

2100 Series Distribution Amplifier

Application Note

The KLEINBIT 2100 Series has been developed to provide flexible splitting arrangements to allow the optimal distribution of G.703 signals.

Local Distribution

There often arises a need to deliver a communications to a number of centres within a local network. Rather than sending each channel on it's own dedicated G.703 link across a national network, it can prove more cost effective to split a single transport stream locally and distribute it across a local network. To achieve a high level of splitting (1 to 5 or greater) the ideal equipment is the KLEINBIT 2100 Series.

This unit features four active cascadable modules giving a maximum splitting capability of 1 to 9..
